

Florida Agriculture Literacy Day

is an annual event held each spring in which hundreds of agriculture industry representatives read a designated children's book about agriculture in elementary school classrooms around the state.

The event is a partnership between Florida Agriculture in the Classroom, Inc. and the Florida Department of Agriculture and Consumer Services.

Florida Agriculture in the Classroom

is a non-profit association charged with educating
Florida students and teachers about the importance of
Florida agriculture. It is funded solely by sales of the agriculture
specialty license plate known as the "Ag Tag."
Florida Agriculture in the Classroom is able to provide
Agriculture Literacy Day books and other related items
free of charge because of the funding
it receives from the Ag Tag.

Green Florida Farms

A Florida Agriculture Literacy Day Book

Written By Gary Seamans Illustrated By Mike Wright

"Educate Students About Florida Agriculture" (352) 846-1391 www.agtag.org This book is dedicated to Florida's school children who will help farmers ensure that Florida stays green for future generations.

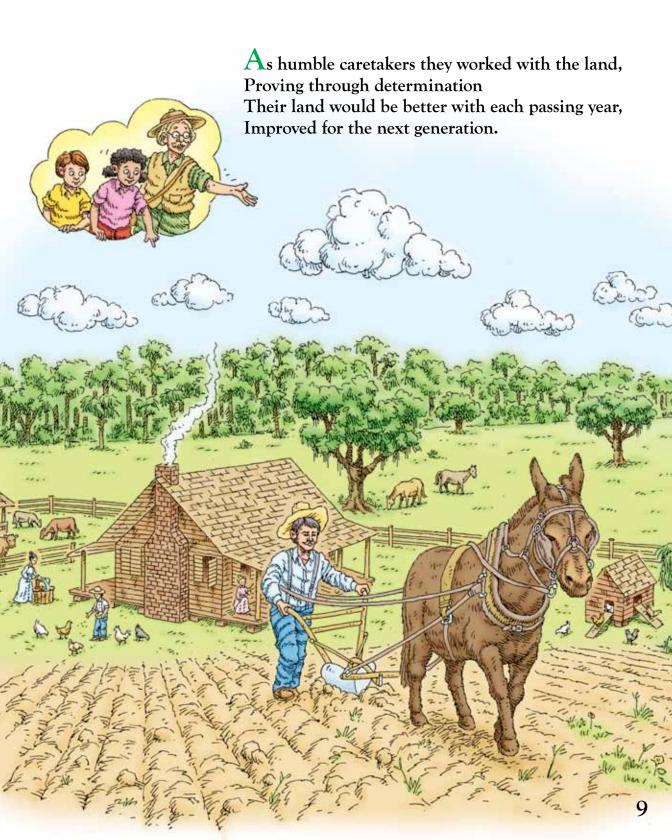

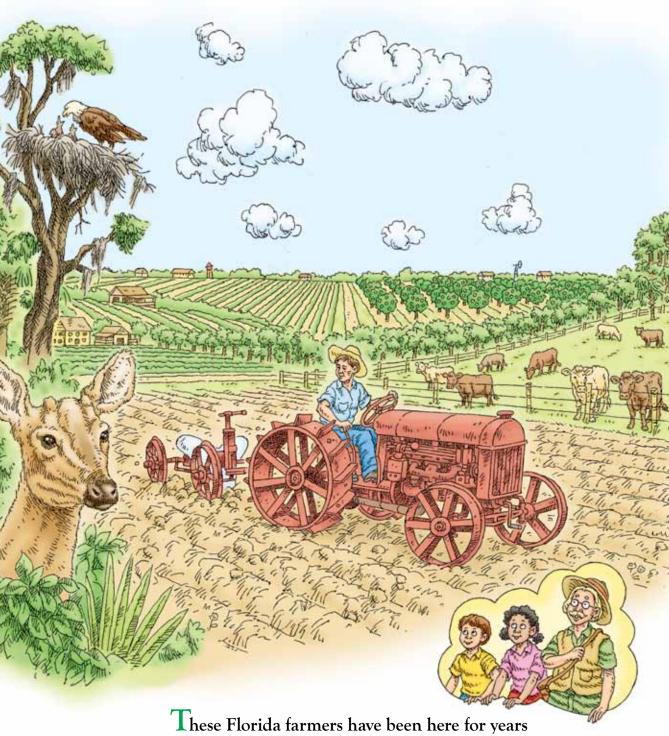

There's more to our state than sunshine and beaches And all of the fun they provide. There are rivers and streams and wide open spaces:

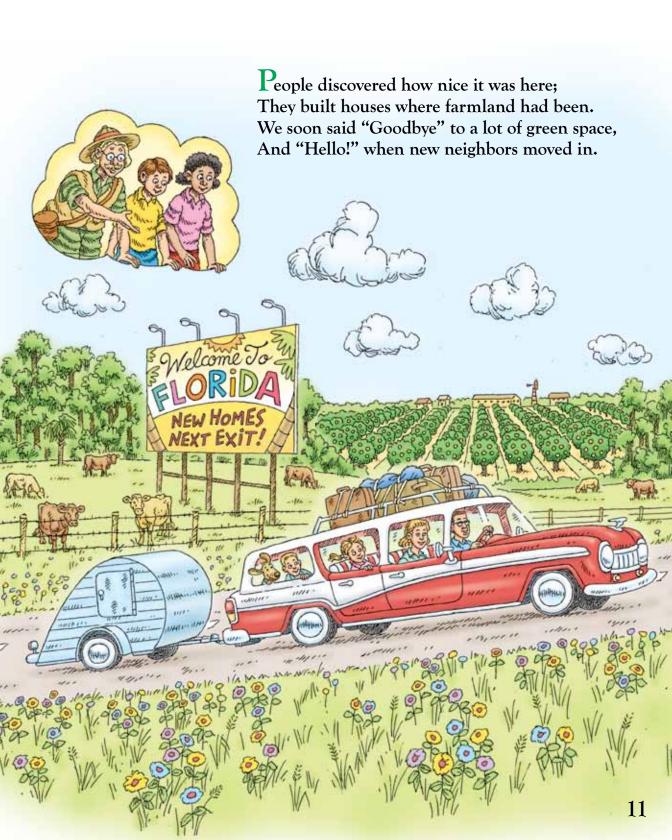

There are rivers and streams and wide open spaces; It's Florida's natural side.

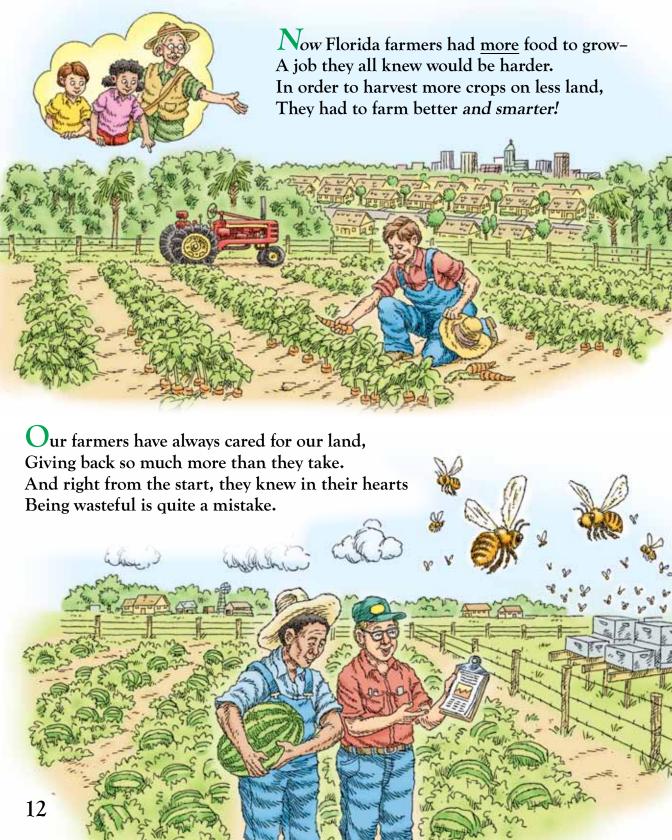

Places where deer and turkey can roam, In woodlands so lush and so green. Places where creatures, protected and rare, Can live where few people have seen. Places where Florida naturally grows, Like few other places around, These are the places and truly green spaces Where Florida's farmers are found.

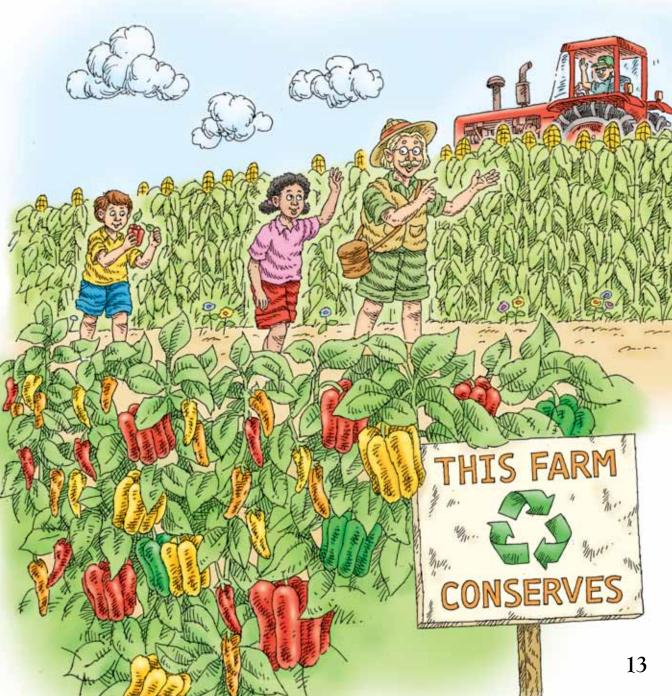

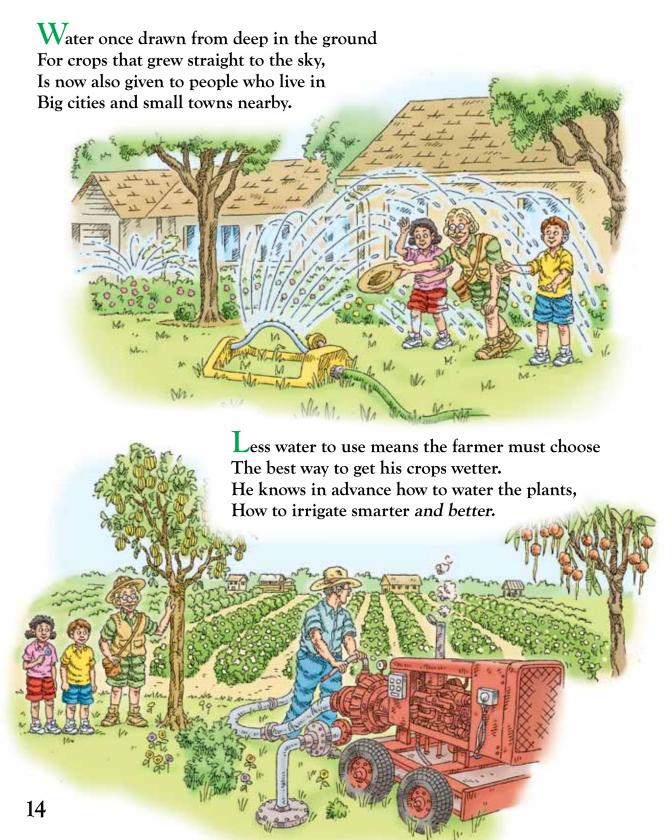

These Florida farmers have been here for year Taking care of the land that you see. Ranches and row crops once covered the state, And wildlife and cattle roamed free.

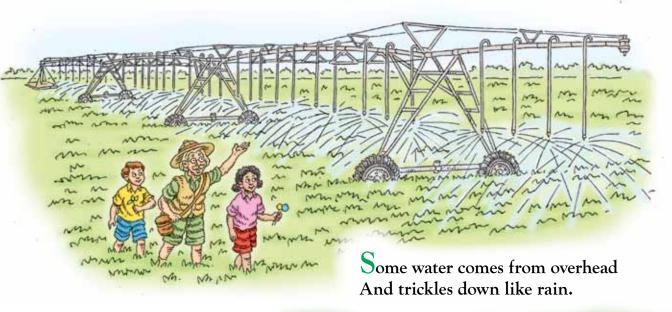

So whether they're growing peppers or corn, From the time that each crop is a seed, Farmers take care not to waste what they have, And the plants only get what they need.

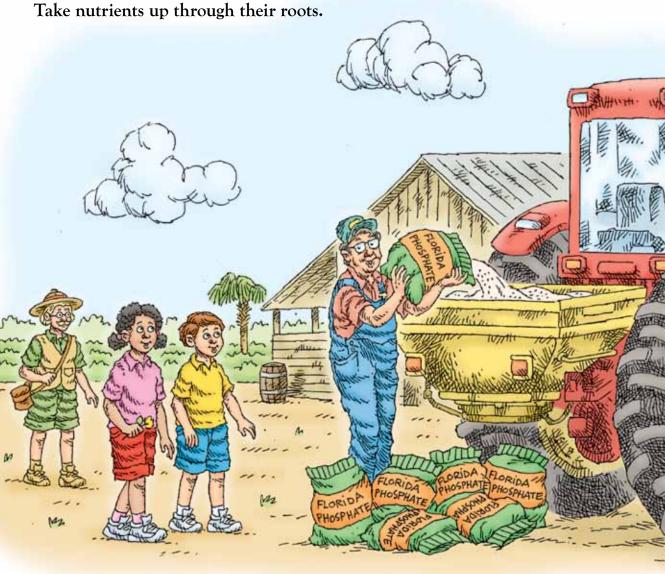

Some water comes through sprinklers
At certain times each day.

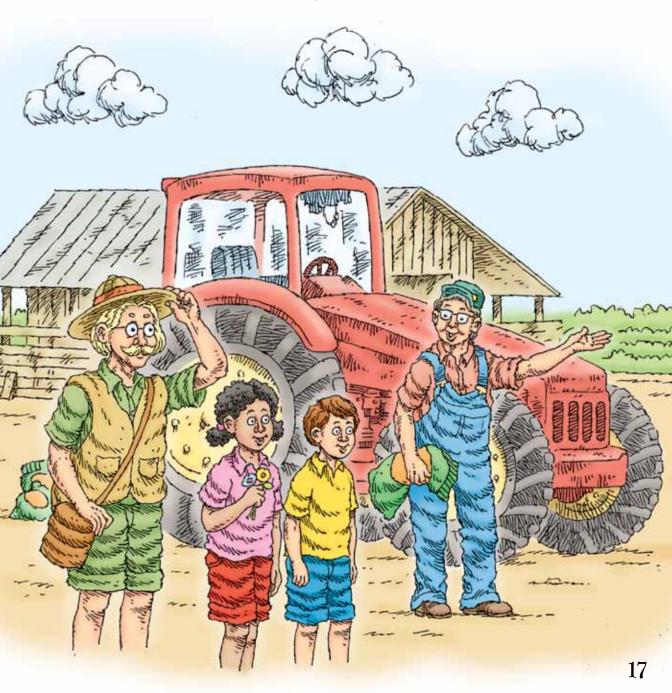

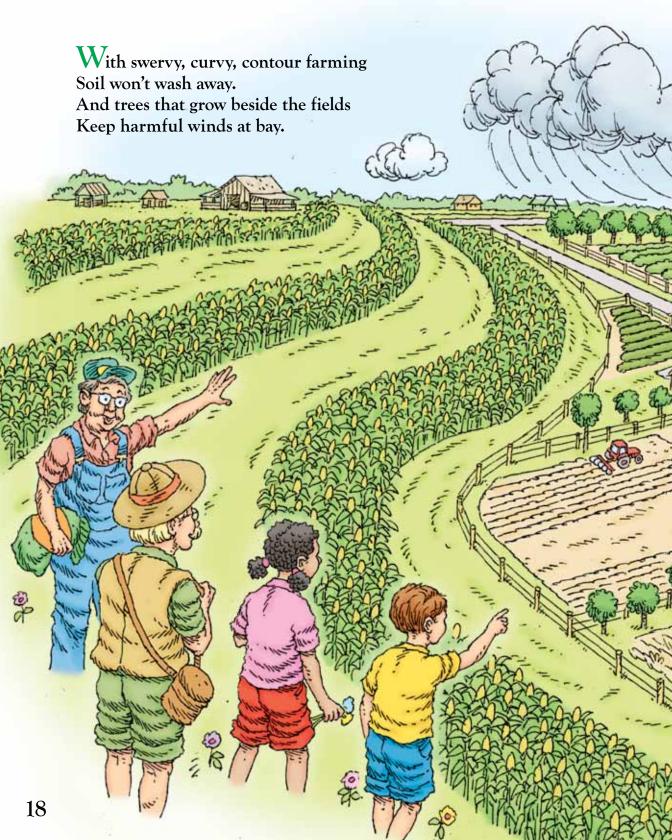

Some water soaks in drip by drip Through special types of hoses. No matter how we irrigate, What every farmer knows is From orange groves to beds of ferns, For every crop we planted, Water is a precious thing we should not take for granted. It's surely worth knowing that while we are growing, We need to eat veggies and fruits.

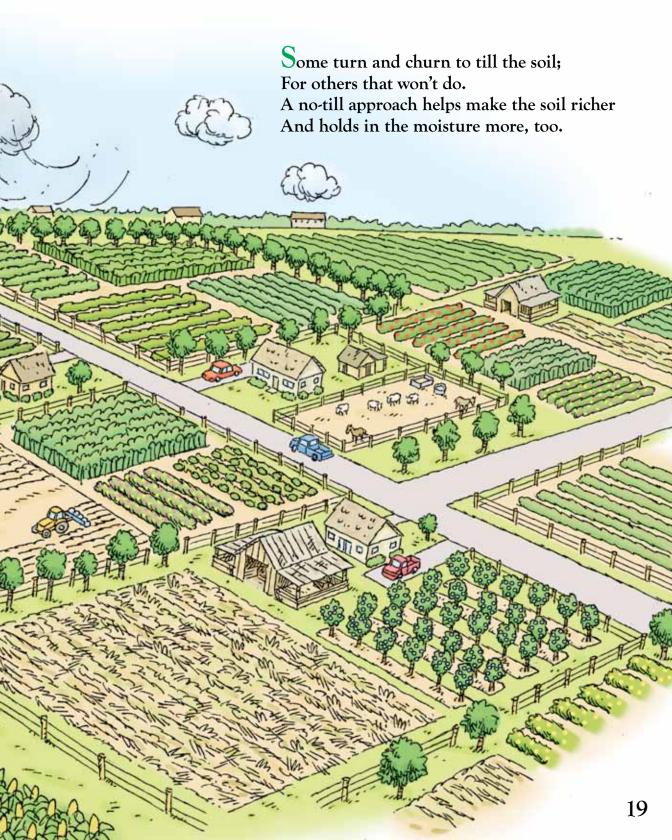

But plants have to feed, too; that's why they need to

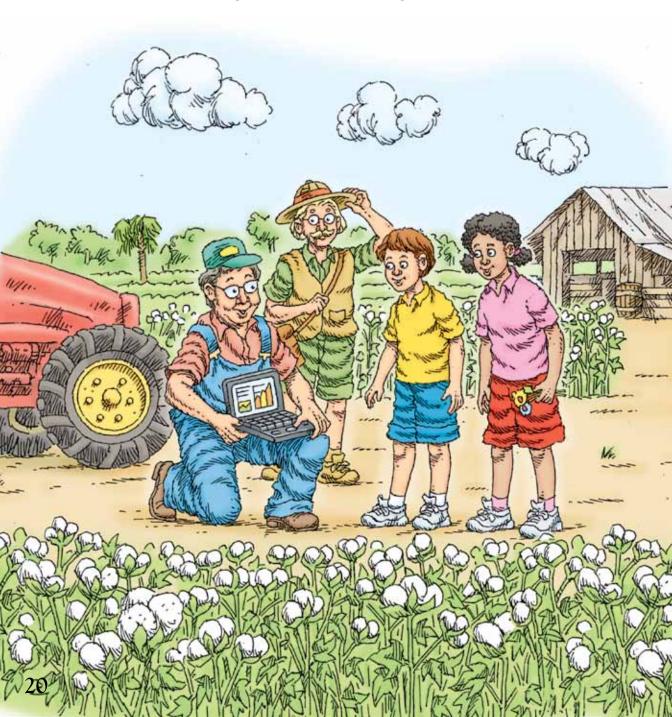

For a crop to succeed, it continues to feed Until there's no food to be found. So after the harvest, each Florida farm must Put nutrients back in the ground. Each one is different, these Florida farms, So are the ways that they plow. Each has their own way to fight soil erosion – Look and I'm sure you'll see how!

I follow a plan when I plow my own land And the effort is worth all the toil! Day in and day out – that's what it's about – Making sure we're conserving the soil.

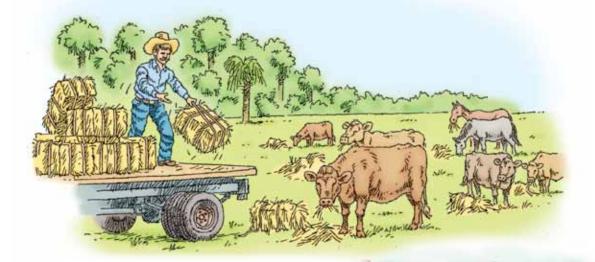

Hydroponic gardening is really quite unique

If growing plants without the dirt

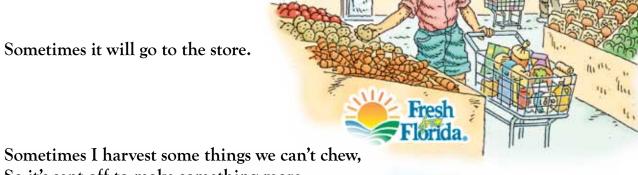

Is something that you seek.

I do not toil with any soil for veggies or for fruits.

Can you believe what I achieve by watering the roots?

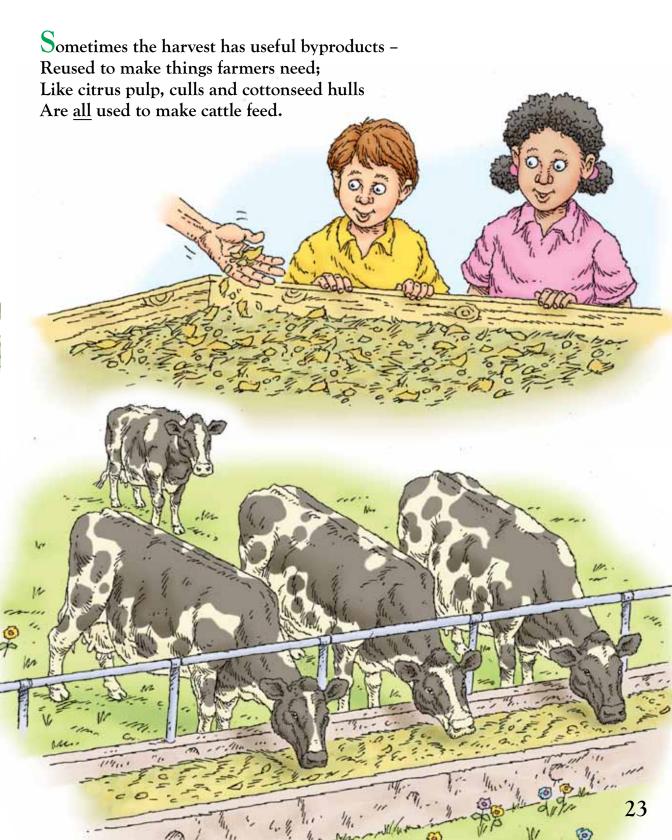

Sometimes my harvest will go to a ranch,

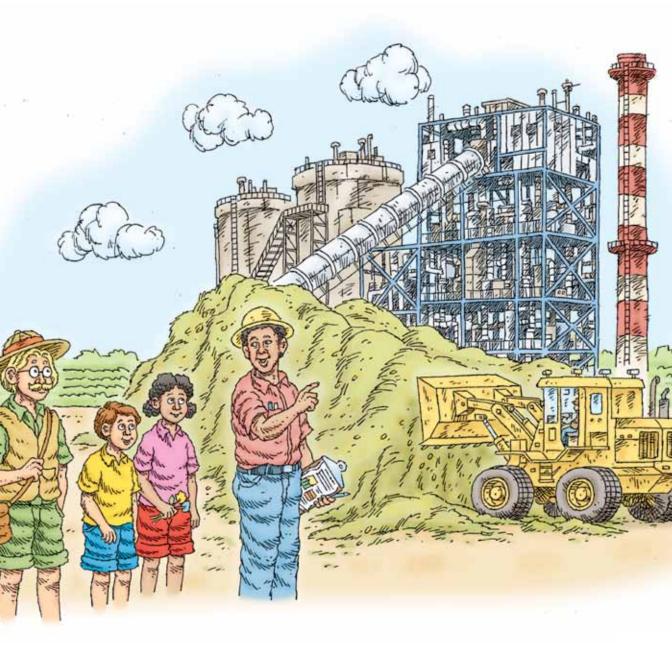

PEANUTS

So it's sent off to make something more.

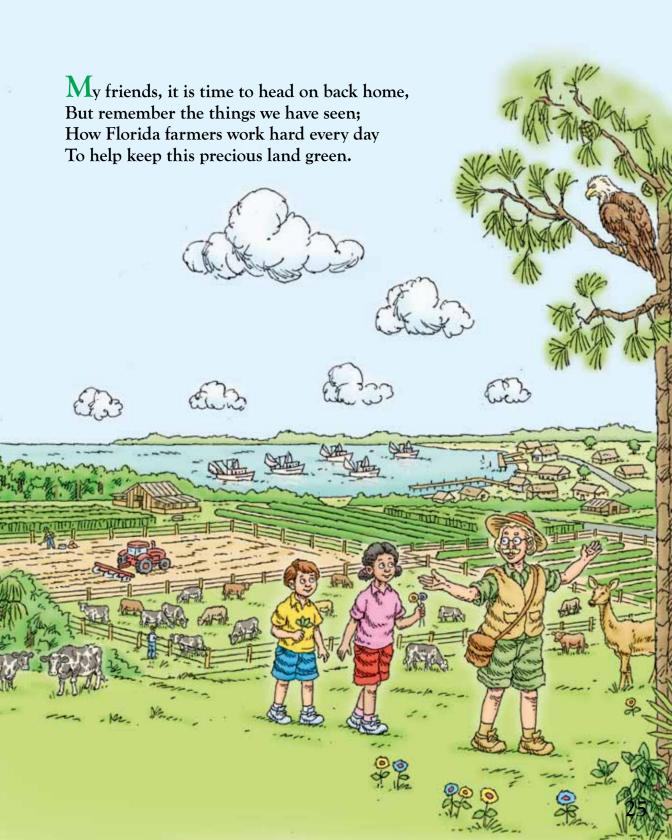

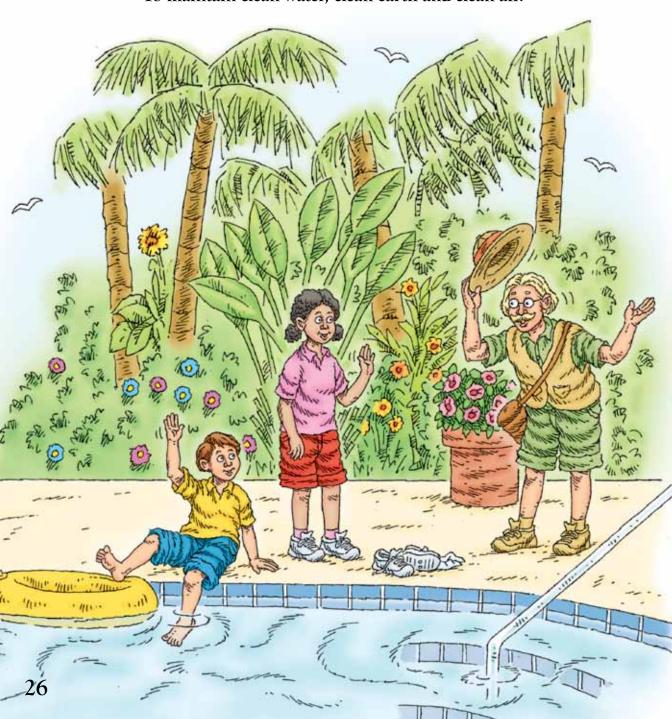

What once we called trash, we now call biomass, A renewable energy source.

It makes biofuel – and that's really cool,

It helps power our country, of course!

Remember – you too have things you can do, And a message I hope you will share: Conserve and recycle, reuse what you can, To maintain clean water, clean earth and clean air.

Definitions

Biomass: Plant material, vegetation or agriculture waste used as a fuel or energy source

Byproduct: Something produced in an industrial or biological process in addition to the principal product; a secondary product.

Conserve: To keep in safety and protect from harm, decay, loss or destruction. The care, protection or management of natural resources.

Contour farming: Plowing, planting and harvesting at right angles to the natural slope of land to reduce soil erosion, protect soil fertility and limit water runoff.

Erosion: The condition in which the earth's surface is worn away by the action of water and wind.

Farm: An area of land, including buildings, used for growing crops, breeding and keeping livestock. An area (often man-made) of water devoted to the raising, breeding or production of a specific aquatic animal.

Hydroponic: Growing plants by placing the roots in liquid nutrient solutions rather than soil; soilless growth of plants.

Irrigate: To supply dry land with water by means of ditches, pipes or streams; to water artificially.

Plow (v.): To break, cut and turn over earth in preparation for sowing seed and planting.

Plow (n.): A tool used in farming to break, cut and turn over earth in preparation for sowing seed and planting.

Ranch: A large plot of land used for raising cattle, sheep or other livestock.

Recycle: To process used material into new products to prevent waste of potentially useful materials.

Renewable energy source: A type of energy which is obtained from natural sources including flowing water, rain, wind, sunshine and other biological processes which are continually available.

Soil: The top layer of the earth's surface, consisting of rock and mineral particles mixed with organic matter. It is capable of retaining water and providing nutrients for plants.

"Florida farmers work hard every day to keep this precious land green."

Learn how Florida farmers protect, conserve and manage the land that provides food, fiber and foliage for our everyday lives.
